

Beam Power Tube

For Pulse-Modulator Service

GENERAL DATA

Electrical:

Heater, for Unipotential Cathode:

Voltage (AC or DC) $6.3 \pm 10\%$ volts
Current at heater volts = 6.3 1.25 amp

Transconductance, for plate volts = 200,
grid-No.2 volts = 200, and plate
ma. = 100 7000 μ hos

Mu-Factor, Grid No.2 to Grid No.1 for
plate volts = 200, grid-No.2 volts =
200, and plate ma. = 100. 4.5

Direct Interelectrode Capacitances:^a

Grid No.1 to plate. 0.24 max. pf

Grid No.1 to cathode & grid No.3 &
internal shield, grid No.2, base
sleeve, and heater. 13.0 pf

Plate to cathode & grid No.3 & in-
ternal shield, grid No.2, base
sleeve, and heater. 8.5 pf

^a Without external shield and base sleeve connected to ground.

^b Continuous commercial service.

^c Duty Factor for the 6293 is defined as the "on" time in microseconds divided by 10,000 microseconds.

"On" time is defined as the sum of the durations of all the individual pulses which occur during any 10,000-microsecond interval.

"Pulse Duration" is defined as the time interval between the two points on the pulse at which the instantaneous value is 70 per cent of the peak value. The peak value is defined as the maximum value of a smooth curve through the average of the fluctuations over the top portion of the pulse.

^d For tube protection, it is essential that sufficient resistance be used in the plate supply circuit, the grid-No.2 supply circuit, and the grid-No.1 supply circuit so that the short-circuit current is limited to 0.5 ampere in each circuit.

^e Averaged over any interval not exceeding 10,000 microseconds. Care should be used in determining the plate dissipation. A calculated value based on rectangular pulses can be considerably in error when the actual pulses have a finite rise and fall time. Plate dissipation should preferably be determined by measuring the bulb temperature under actual operating conditions; then, with the tube in the same socket and under the same ambient-temperature conditions, apply to the tube sufficient dc input to obtain the same bulb temperature. This value of dc input is a measure of the plate dissipation.

Note 1: With 6.3 volts ac on heater.

Note 2: With no external shield. Base sleeve (pin No.8) is grounded.

Note 3: With 6.3 volts ac on heater, dc plate voltage of 300 volts, dc grid-No.2 voltage of 200 volts, and dc grid-No.1 voltage of -33 volts.

Note 4: With the tube in the test circuit (below) under the following conditions: rectangular-wave modulation applied to grid No.1 pulse duration of 1 microsecond approx.; pulse repetition rate of 3000 cps approx.; dc plate supply voltage of 2000 volts; dc grid No.2 supply voltage of 500 volts; dc grid-No.1 supply voltage of -300 volts; peak positive grid-No.1 swing of 100 volts; and load resistance (R_L) of $375 \pm 5\%$ ohms, 50 watts, non-inductive.

OPERATING CONSIDERATIONS

Plate shows no color when tube is operated at maximum CCS ratings.
